Create a new empty project directory ==TYPE: mkdir project  TYPE: cd project TYPE: pwd== then we go into it and  now we're in the project folder. And then if we wanted to make a file called index.html ==TYPE: touch index.html.== And then you would open it in VS code you ==TYPE: code index.html==

==Edit:==
All HTML documents must start with a `<!DOCTYPE>` declaration. Which is:

```
<!DOCTYPE html>
<html>
<head>
<title>Title of the document</title>
</head>

<body>
The content of the document......
</body>

</html>
```

You can type in your information under body.
So an example can be <img src="">
OR a simple sentence

Then go to safari and type the name of the directory
file:////Users/veronicaramirez/project/index.html into the browser

index.html code
Screenshot of how it looks in browser
